PROJECTS

• Otbokhly (Recipe App)

[HTTPS://GITHUB.COM/YUYUGHONIM/OTBOKHLY_APP](https://github.com/yuyughonim/otbokhly_app)

This was my graduation project and the first big project after learning Flutter. Otbokhly was implemented by using Firebase authentication to store user credentials and using Firestore to store the user's favorite recipes. Spoonacular API was used to get recipe details and upload and analyze food photos provided with nutrition details and recommended recipes. Finally, users can also search and filter recipes by different categories. Whether the recipe is vegan friendly or not for different types of dishes.

• Taxi (Uber Clone)

RIDER APP: [HTTPS://GITHUB.COM/YUYUGHONIM/TAXI](https://github.com/yuyughonim/taxi)

DRIVER APP: [HTTPS://GITHUB.COM/YUYUGHONIM/DRIVER](https://github.com/yuyughonim/driver)

This project consists of two apps one for the rider and other for the driver. Taxi was implemented by using Firebase authentication to store user credentials and using Firestore to store both rider's and driver's location. GoogleMaps API was used to get location and direction details. GeoFire package was used to help drivers and riders find each other. Project was made with clean architecture (MVVM) and BLoC as state management.

• MyTasks (ToDo App)

[HTTPS://GITHUB.COM/YUYUGHONIM/MY_TASKS](https://github.com/yuyughonim/my_tasks)

MyTasks is implemented by SQLite, which is a package that helps to write SQL code in Flutter to persist data, and a local notifications package that helps to deliver local notifications to the user's device. The project is implemented with clean architecture (MVVM) and BLoC as state management.

EDUCATION

• Bachelor Of Computer Science (BCS)

ARAB OPEN UNIVERSITY

2018 - 2022

GPA - VERY GOOD (3.1)

SKILLS

Dart

Flutter

OOP

Design Pattern (MVVM)
